

SQL_Week3_Day3_HandsOn_Vasundhara

ANSI SQL using MS-SQL Server

Pre-Requisites: Before starting with problem solving, please make sure that you have created a database and restored data (refer [Sample Database create objects.sql and load data.sql](#))

Level-1: Problem 1 - Basic Customer Order Report

Scenario:

The store manager wants a simple report showing customer orders along with their order dates and status. This report will help track pending and completed orders.

Requirements

1. Retrieve customer first name, last name, order_id, order_date, and order_status.
2. Display only orders with status Pending (1) or Completed (4).
3. Sort the results by order_date in descending order.

Technical Constraints

- Use SELECT statement.
- Use WHERE clause with logical operators (AND/OR).
- Use ORDER BY clause.
- Use INNER JOIN between customers and orders tables.

Expectations:

Students should write a correct query using joins and filters, and properly order the result set.

Learning Outcome

Understand basic SELECT queries, filtering using WHERE conditions, logical operators, and sorting using ORDER BY clause with INNER JOIN.

Source Code:

File Name: Problem Statement 1.sql

```
1  SELECT
2      c.first_name,
3      c.last_name,
4      o.order_id,
5      o.order_date,
6      o.order_status
7  FROM customers c
8  INNER JOIN orders o
9      ON c.customer_id = o.customer_id
10 WHERE o.order_status IN (1,4)
11 ORDER BY o.order_date DESC;
```

Output:

Output File: Problem Statement 1.sql

The screenshot shows the SQL Server Enterprise Manager interface. The query window displays the results of a query executed successfully. The results are shown in a table with 5 columns: first_name, last_name, order_id, order_date, and order_status. The table contains 27 rows of data. The status bar at the bottom indicates that the query was executed successfully on localhost (17.0 RTM) at 00:00:00, with 165 rows and 4 columns returned.

Explanation:

This SQL query joins the **customers** and **orders** tables using **customer_id** to get customer names along with their order details. It filters orders where the **order_status** is **1 or 4** and sorts the results by **order_date in descending order**. The output shows the customer's **first name, last name, order ID, order date, and order status** for those matching orders.

Level-1: Problem 2 - Product Price Listing by Category Scenario:

The sales team wants a product listing categorized by product category along with brand details to understand product distribution.

Requirements

1. Display product_name, brand_name, category_name, model_year, and list_price.
2. Filter products with list_price greater than 500.
3. Sort results by list_price in ascending order.

Technical Constraints

- Use SELECT statement.
- Use WHERE clause.
- Use ORDER BY clause.
- Use INNER JOIN between products, brands, and categories tables.

Expectations:

Students should correctly join multiple tables and apply filtering and sorting logic.

Learning Outcome

Learn multi-table joins, filtering numeric conditions, and sorting query results.

Source Code:

File Name: Problem Statement 2.sql

```
1  SELECT
2      p.product_name,
3      b.brand_name,
4      c.category_name,
5      p.model_year,
6      p.list_price
7  FROM products p
8  INNER JOIN brands b
9      ON p.brand_id = b.brand_id
10 INNER JOIN categories c
11     ON p.category_id = c.category_id
12 WHERE p.list_price > 500
13 ORDER BY p.list_price ASC;
14
```

75	Electra Straight 8 3i - 2018	Electra	Cruisers Bicycles	2018	909.99

Explanation:

This SQL query joins the **products**, **brands**, and **categories** tables to display product details along with their brand and category names. It only shows products whose **price is greater than 500**. The output lists the **product name, brand, category, model year, and price**, sorted by **price in ascending order (lowest to highest)**.

Level-2: Problem 1 - Store Wise Sales Summary Scenario:

The regional manager wants to analyze total sales generated by each store.

Requirements

1. Display store_name and total sales amount.
2. Calculate total sales using (quantity * list_price * (1 - discount)).
3. Include only completed orders (order_status = 4).
4. Group results by store_name.
5. Sort total sales in descending order.

Technical Constraints

- Use INNER JOIN between stores, orders, and order_items tables.
- Use GROUP BY clause.
- Use aggregate functions such as SUM().
- Use WHERE clause for filtering.
- Use ORDER BY clause.

Expectations:

Students must write a grouped query with calculated columns and apply proper filtering.

Learning Outcome

Understand GROUP BY, aggregate functions, calculated fields, and filtering grouped data.

Source Code:

File Name: Problem Statement 3.sql

```
1  SELECT
2      s.store_name,
3      SUM(oi.quantity * oi.list_price * (1 - oi.discount)) AS total_sales
4  FROM stores s
5  INNER JOIN orders o
6      ON s.store_id = o.store_id
7  INNER JOIN order_items oi
8      ON o.order_id = oi.order_id
9  WHERE o.order_status = 4
10 GROUP BY s.store_name
11 ORDER BY total_sales DESC;
12
```

Output:

Output File: Problem Statement 3.sql

The screenshot shows a SQL IDE window with the query results displayed in a table. The table has two columns: 'store_name' and 'total_sales'. The results are ordered by 'total_sales' in descending order. The first row is 'Baldwin Bikes' with a total sales of 4701209.5663. The second row is 'Santa Cruz Bikes' with a total sales of 1255491.6489. The third row is 'Rowlett Bikes' with a total sales of 705914.0289. The IDE interface includes a menu bar, a toolbar, and a status bar at the bottom indicating the query was executed successfully.

	store_name	total_sales
1	Baldwin Bikes	4701209.5663
2	Santa Cruz Bikes	1255491.6489
3	Rowlett Bikes	705914.0289

Explanation:

This SQL query joins the **stores**, **orders**, and **order_items** tables to calculate the **total sales for each store**. It only includes orders where the **order status is 4** and calculates sales using quantity, price, and discount. The output shows each **store name with its total sales amount**, sorted from **highest to lowest sales**.

Level-2: Problem 2 - Product Stock and Sales Analysis Scenario:

The inventory manager wants to compare stock availability and total quantity sold for each product.

Requirements

1. Display product_name, store_name, available stock quantity, and total quantity sold.
2. Include products even if they have not been sold (use appropriate join).
3. Group results by product_name and store_name.
4. Sort results by product_name.

Technical Constraints

- Use LEFT JOIN between stocks and order_items.
- Use INNER JOIN with products and stores tables.
- Use GROUP BY clause.
- Use SUM() aggregate function.
- Use ORDER BY clause.

Expectations:

Students should correctly use different join types (INNER and LEFT), grouping, and aggregate functions.

Learning Outcome

Develop strong understanding of different JOIN types (INNER, LEFT), aggregation, grouping data, and analyzing relational datasets.

Source Code:

File Name: Problem Statement 4.sql

```
1  SELECT
2      p.product_name,
3      s.store_name,
4      st.quantity AS available_stock,
5      SUM(oi.quantity) AS total_quantity_sold
6  FROM stocks st
7  INNER JOIN products p
8      ON st.product_id = p.product_id
9  INNER JOIN stores s
10     ON st.store_id = s.store_id
11  LEFT JOIN order_items oi
12     ON p.product_id = oi.product_id
13  GROUP BY
14     p.product_name,
15     s.store_name,
16     st.quantity
17  ORDER BY
18     p.product_name;
19
```

Explanation:

This SQL query joins **stocks**, **products**, **stores**, and **order_items** tables to show each product available in every store. It displays the **product name**, **store name**, **available stock**, and the **total quantity sold**. The output lists these details for each product-store combination and is **grouped and sorted by product name**.
